# Design and Construction for Energy Efficiency of Residential Buildings in Hong Kong

## Mr Man-kit Leung

Sub-Committee Chairman, Scientific Committee, WSBE17 Hong Kong

Director and Chairman of Policy & Research Committee  
Hong Kong Green Building Council

# ENERGY SAVING PLAN

For Hong Kong's Built Environment  
2015~2025+

Environment Bureau in collaboration with  
Development Bureau  
Transport and Housing Bureau  
May 2015

- 2 Government buildings to achieve 5% electricity reduction target by 2020 (2014 as base); further reduction from 2020-2025 to be determined in 2019-20

- Gross Floor Area (GFA) concessions for private-sector green building projects;

## SUMMARY OF ENERGY SAVING PLAN FOR HONG KONG 2015~2025+

### TARGET

#### ENERGY INTENSITY

Hong Kong to achieve energy intensity reduction by 40 % by 2025 using 2005 as the base

Year  
2025

-40%

Be "Energy Aware" and "Energy Wise"

#### GOVERNMENT BUILDINGS AND PUBLIC HOUSING

- New government buildings with construction floor area of >5,000 m<sup>2</sup> with central air-conditioning or >10,000m<sup>2</sup> to achieve at least BEAM Plus Gold; and
- New public housing to achieve at least BEAM Plus Gold ready

### KEY ACTIONS

- 1 Lead the energy saving and green building transformation through government buildings, public housing and public sector development (see targets)

- 2 Government buildings to achieve 5% electricity reduction target by 2020 (2014 as base); further reduction from 2020-2025 to be determined in 2019-20

#### ECONOMICS

#### ✓ Already in existence

- 1/7th of buildings in Hong Kong (about 6,400 buildings) participated in the \$450 million Building Energy Efficiency Fund Scheme (BEEFS) programme;
- district cooling at Kai Tak;
- Gross Floor Area (GFA) concessions for private-sector green building projects;
- and approximately \$100 million power companies' Eco Building Fund (CLP Power Hong Kong (CLP)) and Power Smart Fund (The Hongkong Electric Company Limited (HEC)) for energy saving 2014-18

Periodic review, expand and/or tighten relevant energy-related standards:

- 3 Buildings Energy Efficiency Ordinance (BEEO);
- 4 Building (Energy Efficiency) Regulation, (B(EE)R); and
- 5 Energy Efficiency (Labelling of Products) Ordinance (EELPO)

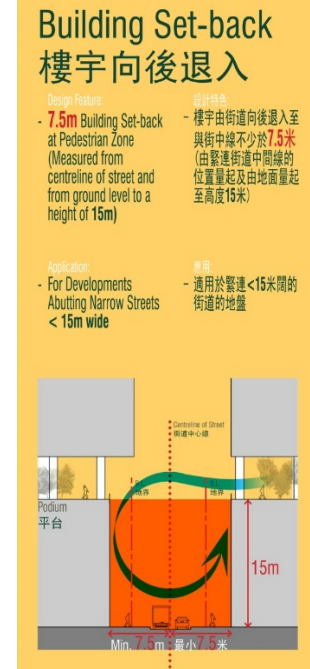

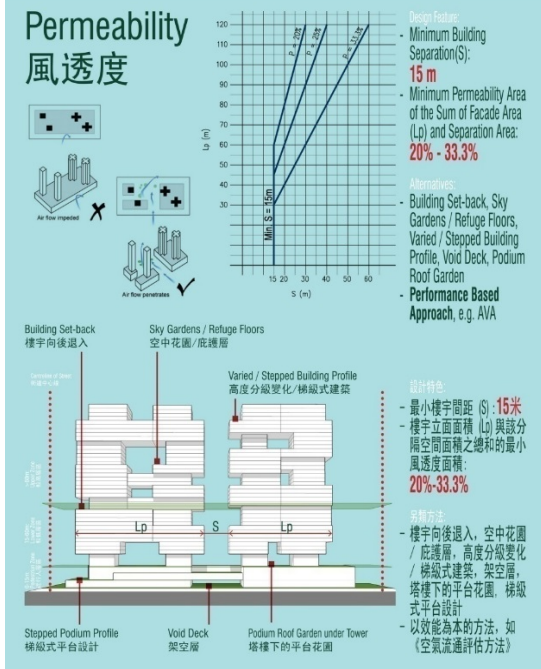

✓ Already in existence  
BEEO, B(EE)R and EELPO

#### REGULATORY

# Sustainable Building Design Guidelines

Buildings Department,  
HKSAR Government

# **Overall Thermal Transfer Value**

(OTTV) standard, was first  
introduced in 1995  
and was tightened in 2011.

Extent of Application:  
Commercial buildings  
(office, retail), and hotels

**CODE OF PRACTICE**

energy efficiency / use in **operational phase**

Guidelines on Design and Construction Requirements  
for Energy Efficiency of Residential Buildings  
2014

# APP-156

## Implementation

16. This practice note is applicable to all new building plans or major revision of building plans for development proposals involving residential buildings submitted to the BA for approval on or after 1 April 2015. For the avoidance of doubt, this practice note is also applicable to building plans which have been previously disapproved and are resubmitted for approval on or after 1 April 2015.

17. This practice note does not apply to alteration and addition works or change in use not resulting in a new residential building.

Effective Date:

**1 April 2015**

Buildings Department

Practice Note for Authorized Persons,  
Registered Structural Engineers and  
Registered Geotechnical Engineers

APP-156

### Design and Construction Requirements for Energy Efficiency of Residential Buildings

#### Introduction

In Hong Kong, buildings accounted for some 90% of the total electricity consumption<sup>1</sup>. Around 26% of the total electricity of the territory was consumed by residential buildings. Enhancing the energy performance of residential buildings forms an important part of the Government's overall strategy towards the achievement of a more environmentally friendly and sustainable built environment. In this connection, the Buildings Department (BD) commissioned a consultancy study on the design and construction requirements of residential buildings for energy efficiency (Consultancy Study) in 2010. This practice note promulgates the measures formulated in the Consultancy Study and sets out the procedures to implement the measures for improving the energy efficiency of residential buildings.

2. For avoidance of doubt, "residential building" in the context of this practice note means a domestic building as defined in section 2(1) of the Buildings Ordinance (BO) but does not include those premises having an air-conditioning operation profile not similar to that of a normal domestic household, such as hotel, guesthouse, residential care home for the elderly / persons with a disability.

#### Improvement of Energy Efficiency of Residential Buildings

3. Based on the Consultancy Study, a set of design and construction requirements is devised for improving the energy efficiency of residential buildings. These design and construction requirements are promulgated in the "Guidelines on Design and Construction Requirements for Energy Efficiency of Residential Buildings" (Guidelines) which has been issued and uploaded to the BD website at [www.bd.gov.hk](http://www.bd.gov.hk). The Guidelines set out the following key measures to enhance energy efficiency of residential buildings:-

- (a) controlling Residential Thermal Transfer Values (RTTV) of building envelopes, including visible light transmittance (VLT<sub>Glass</sub>) and external reflectance (ER<sub>Glass</sub>) of the glazed portions; and
- (b) promoting natural ventilation in window design for maintaining thermal comfort (NV<sub>TC</sub>).

/4. ....

<sup>1</sup> Hong Kong End-use Data 2012 published by the Electrical and Mechanical Services Department

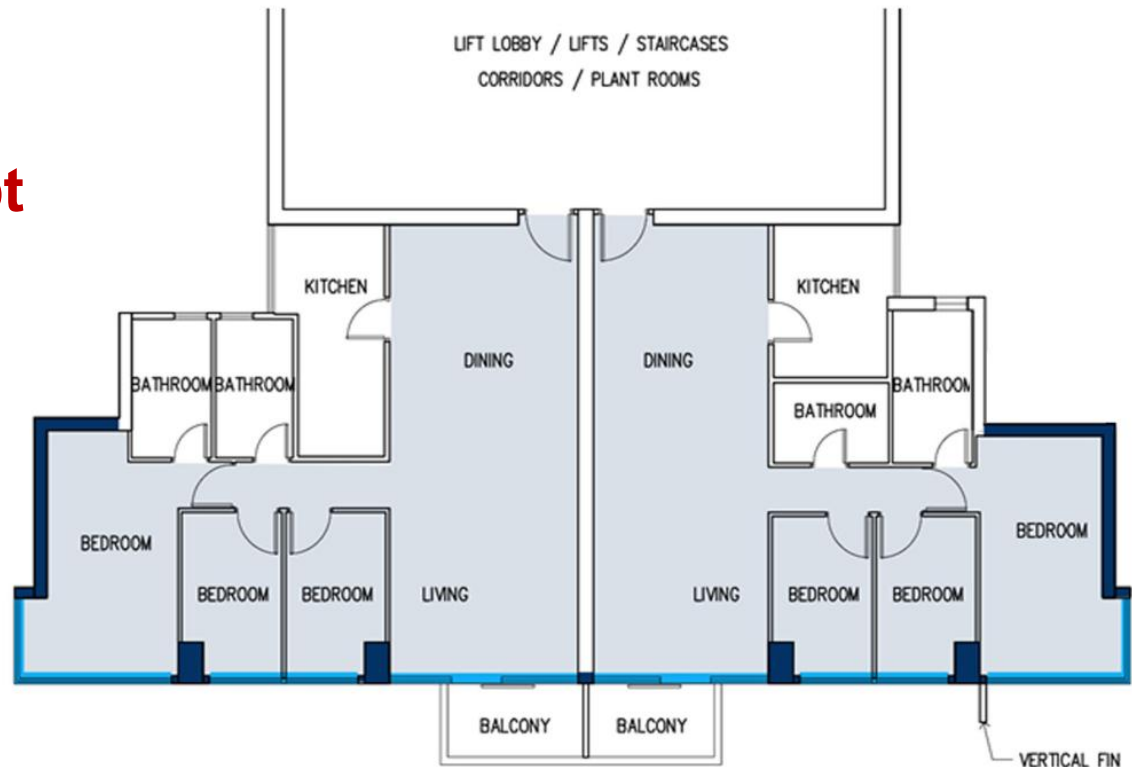

Residential Thermal Transfer Value

Natural Ventilation

# Wall Areas to be included in $RTTV_{wall}$ calculations

External walls of the **all enclosed spaces of residential units, except those of bathrooms & enclosed kitchens**

# RTTV

Average Heat Gain per  
Unit Facade / Roof Area

Radiation  
Through  
**Glazing**

Conduction  
Through  
Opaque  
Wall / Roof

Conduction  
Through  
**Glazing**

## Key Difference with OTTV

**Default Operation and Occupancy Patterns for Residential Buildings**

**Independent Suitable Values for Roof and Wall**

## Exclusions

**Internal shading devices**, such as draperies and blinds;  
**Solar reflection or shading from adjacent developments**;  
and Use of energy-efficient **building services equipment and appliances**.

# RTTV<sub>wall</sub>

## RTTV<sub>wall</sub> Calculation Formula

$$= [41.75 \text{ WWR} \times \text{SC} \times \text{ESC} \times G_w] + [3.57(1-\text{WWR}) \times U_w \times \alpha \times G_w] + [0.64 \text{ WWR} \times U_f \times G_w]$$

**Radiation  
Through  
Glazing**

**Conduction  
Through  
Opaque Wall**

**Conduction  
Through  
Glazing**

**WWR:**

Window to Wall Ratio

**G<sub>w</sub>:**

Wall Orientation Factor

**SC :** Shading Coefficient

**ESC:** Shading Coeff. of External  
Shades

**U<sub>w</sub>:** U-value of the opaque wall

**α :** Absorptivity of the wall

**U<sub>f</sub>:** U-value of the glazing

# RTTV<sub>roof</sub>

## RTTV<sub>roof</sub> Calculation Formula

$$= [41.10(\text{SRR})(\text{SC}_r)(\text{G}_s)] + [3.47(1-\text{SRR}) U_r \alpha_r \text{G}_s] + [0.40(\text{SRR})U_{sl}\text{G}_s]$$

Radiation  
Through  
Skylight

Conduction  
Through  
Roof

Conduction  
Through  
Skylight

**SRR** : Skylight to Roof Ratio

**G<sub>s</sub>** : Roof Orientation Factor

**SC<sub>r</sub>**: Shading Coeff. of  
Skylight Glazing

**U<sub>r</sub>**: U-value of the roof  
**α<sub>r</sub>**: Absorptivity of the roof

**U<sub>sl</sub>** : U-value of the  
skylight glazing

# Sensitivity Tests

## RTTV

Average distance between window sill and projection = 2.35m; Projection = 0.1m

Average distance between window sill and projection = 1.85m; Projection = 0.1m

One of the pre-requisites for the granting of GFA concessions under PNAP APP-151 :-

$$RTTV_{Wall} \leq 14 \text{ W/m}^2 \text{ \& } RTTV_{Roof} \leq 4 \text{ W/m}^2 ;$$

# Daylight & Glare Control

Visible Light Transmittance  $\geq$  **50%**

Glass External Reflectance  $\leq$  **20%**

# Incentive for Effective Sunshade

For projection

**$\leq 500\text{mm}$**  (facing N [NNW to NNE]) &  
 **$\leq 750\text{mm}$**  (facing other orientations)

\* For sunshades **within re-entrant less than 4.5m**, the projection should not be more than **500mm**

For projection

**$> 500$  and  $\leq 1500\text{mm}$**  (facing N) &  
 **$> 750$  and  $\leq 1500\text{mm}$**  (facing others),

- OPF not less than 0.2 or 0.5 respectively
- Not causing obstruction to prescribed windows

# Complex Shading & Self-Shading

Equation:

$$\text{ESC} = (\sum E_r \cdot I_D + I_d) / (\sum I_D + I_d)$$

ESC: External Shading Coefficient

$E_r$ :  $A_e/A$  is the fraction of area exposed to direct solar radiation

$I_D$ : Direct solar radiation for a specific time given in tables

$I_d$ : Diffuse solar radiation for a specific time given in tables

# Simplicity

## Deemed to Satisfy RTTV Criterion

Category	Average Values		Deem to Satisfy Criteria for SC [Facade]	Average SC [Facade]	
	WWR	Absorptivity*			
<b>NNE to NNW (Category A)</b>	0.38	0.37	$\leq 0.56$	0.45	OK
<b>NNW to NNE (Category B)</b>	0.53	0.30	$\leq 0.59$	0.57	OK

\* Any ONE external finish material applied on the facade in one orientation constituting **more than 60% of the gross wall area** can be regarded as dominant and its absorptivity can be taken as the average absorptivity of the facade in that orientation for compliance check on Deemed to Satisfy RTTV<sub>wall</sub> Criteria

Facade Facing NNW to NNE (Category B)

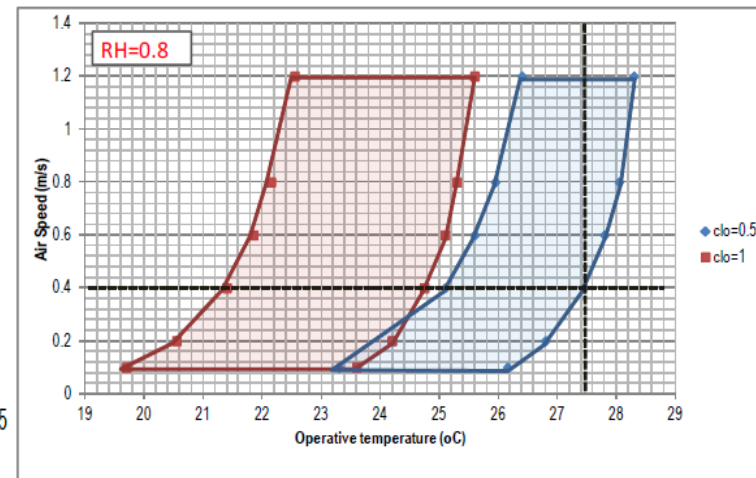

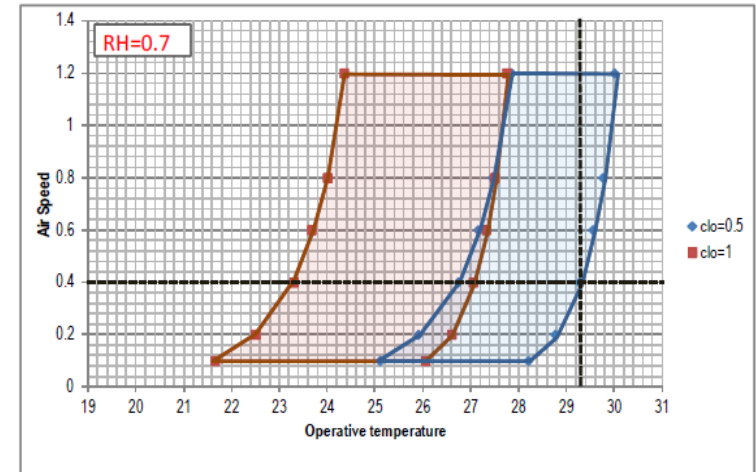

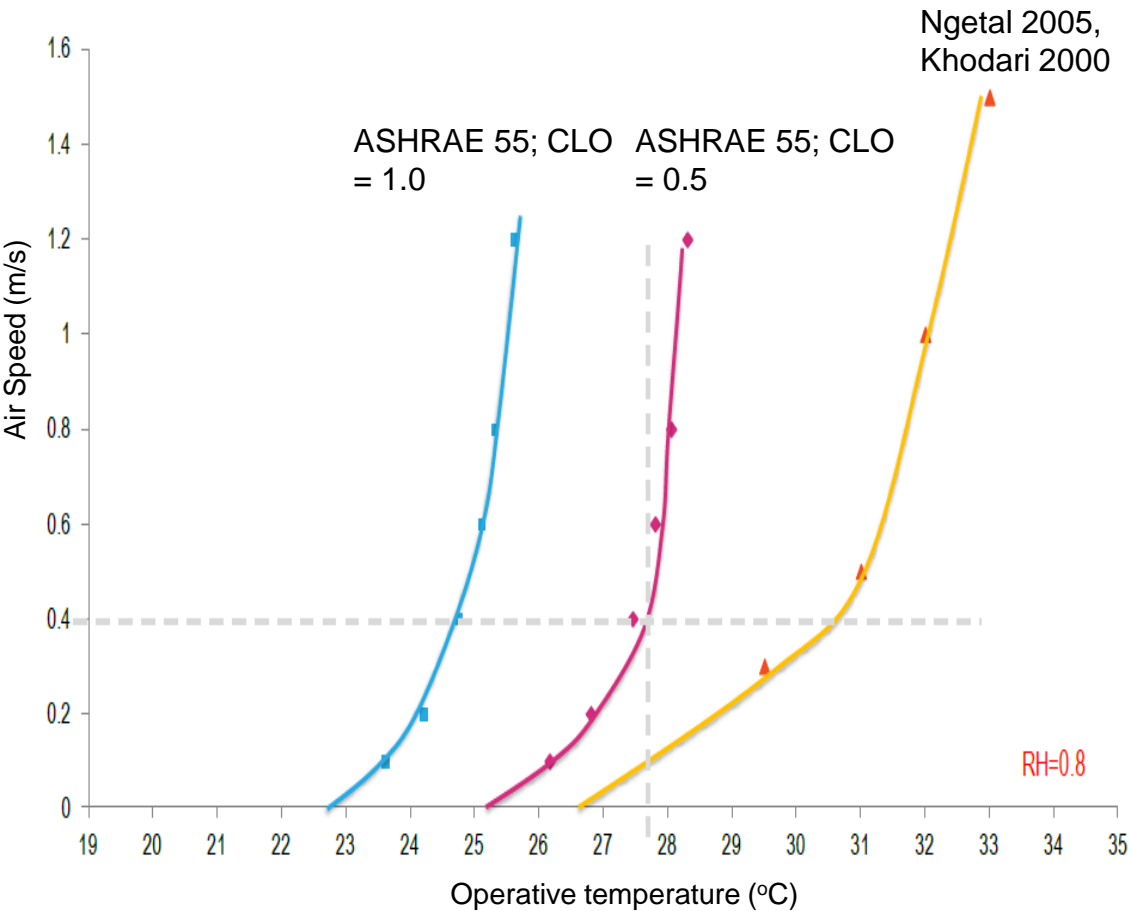

Residential Thermal Transfer  
Value

Natural Ventilation

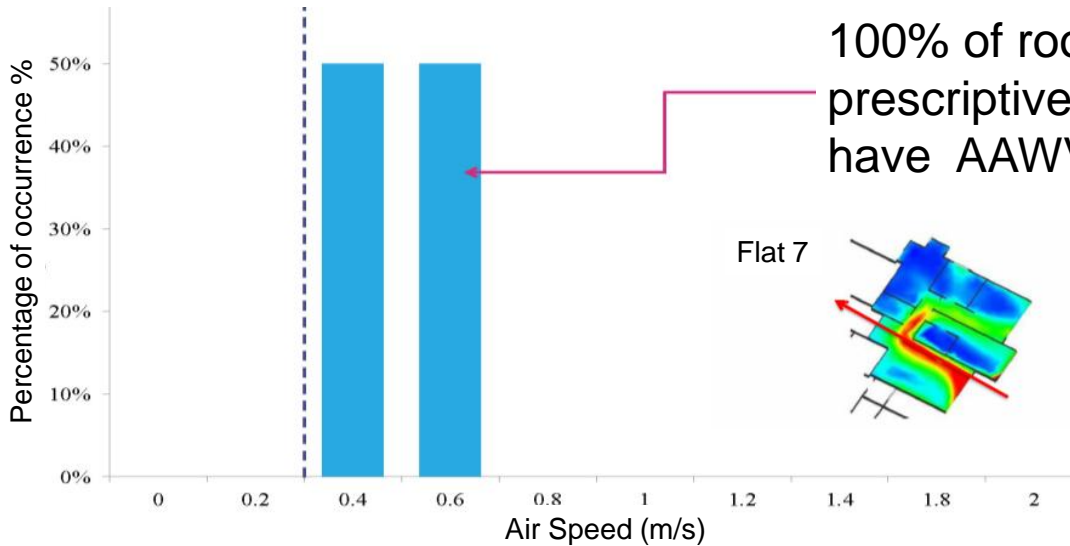

# Adaptive Comfort Model

# Effect of Window Size

# Formulation

100% of rooms that comply with the prescriptive test for **Cross Ventilation** have  $AAWV > 0.4\text{m/s}$

Flat 7

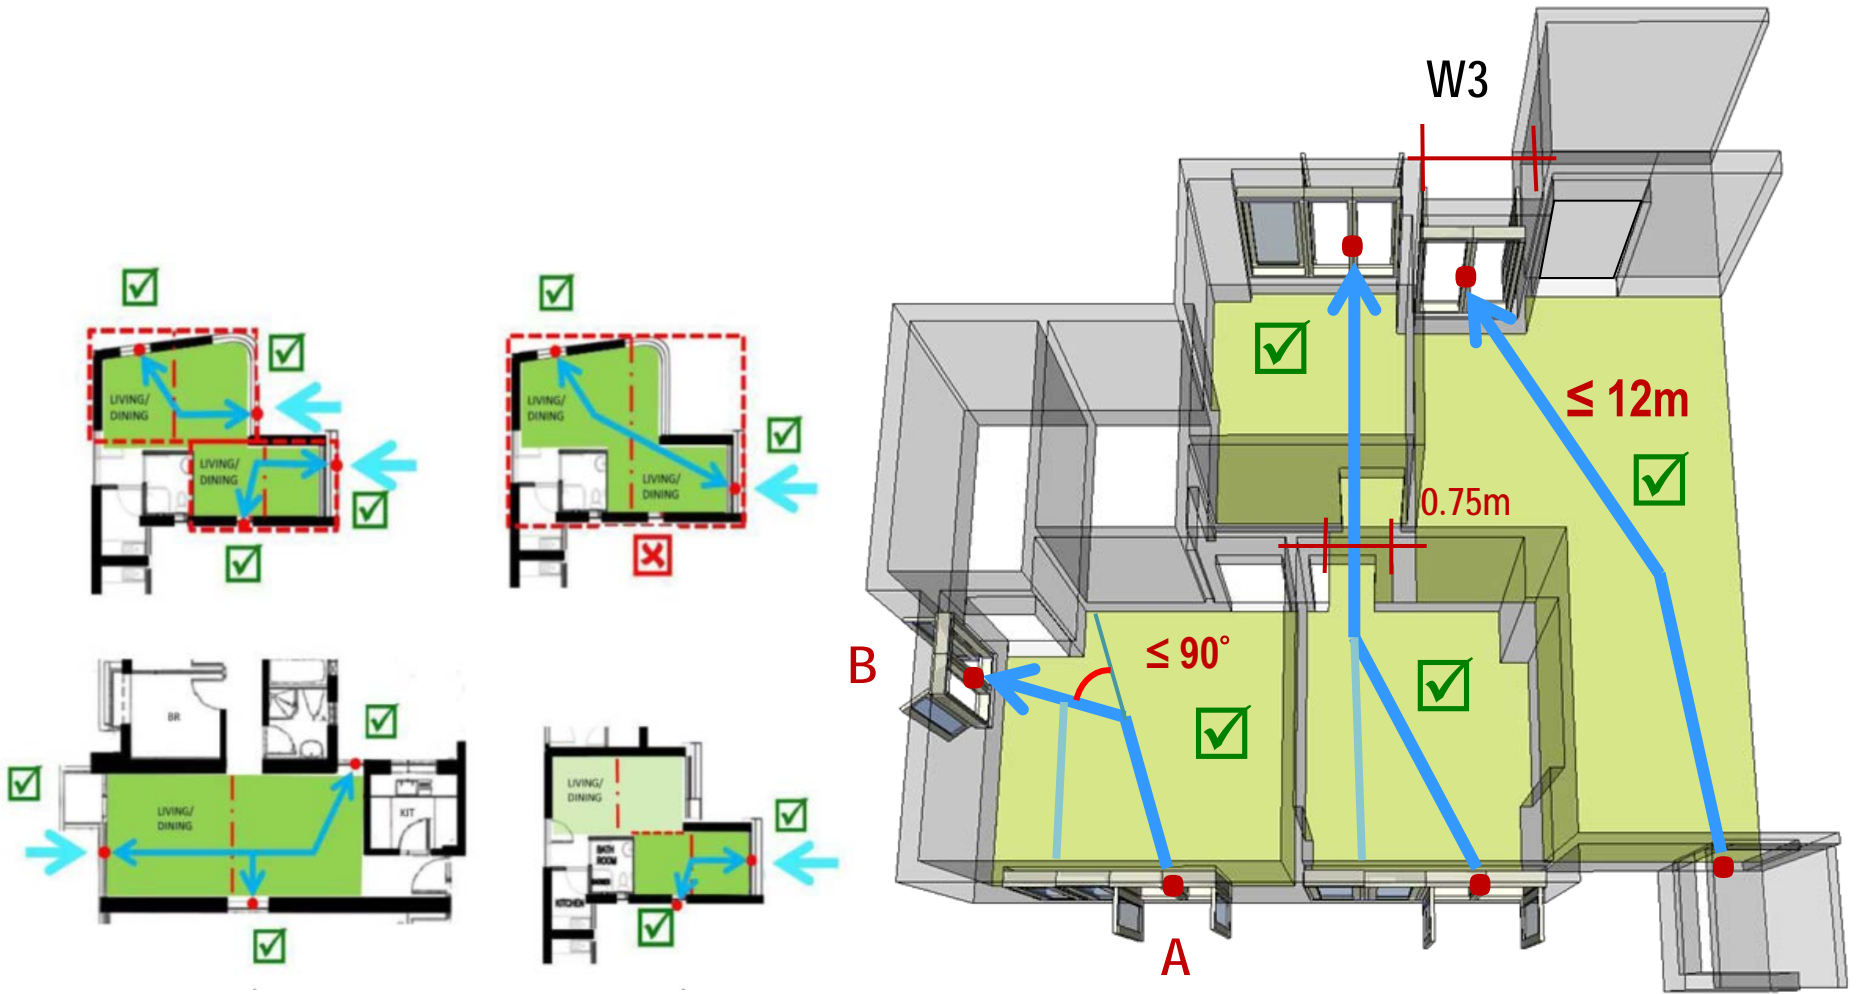

60% of rooms that pass with the prescriptive test for **Single-sided Ventilation** have  $AAWV > 0.4\text{m/s}$

Flat 7

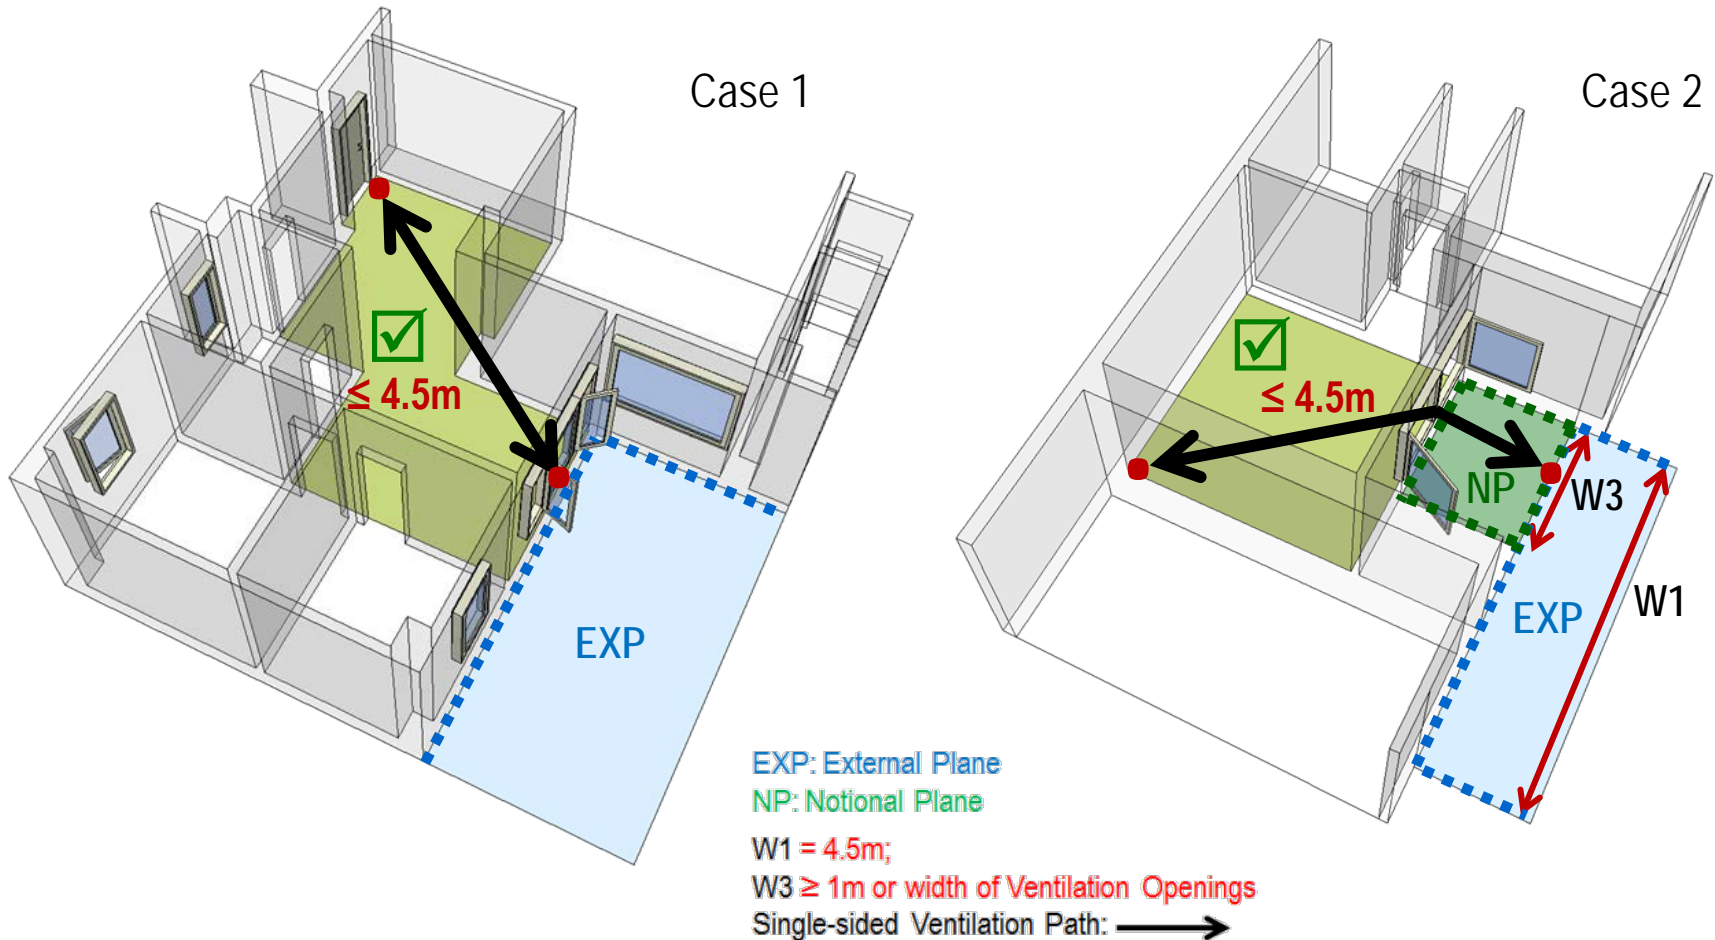

# Cross Ventilation $NV_c$

# Single-Sided Ventilation $NV_{ss}$

# Single-Sided Ventilation $NV_{ss}$

Total openable window area  
in aggregate

$\geq$  **one-fifth (1/5th)**  
of the UFA of the room

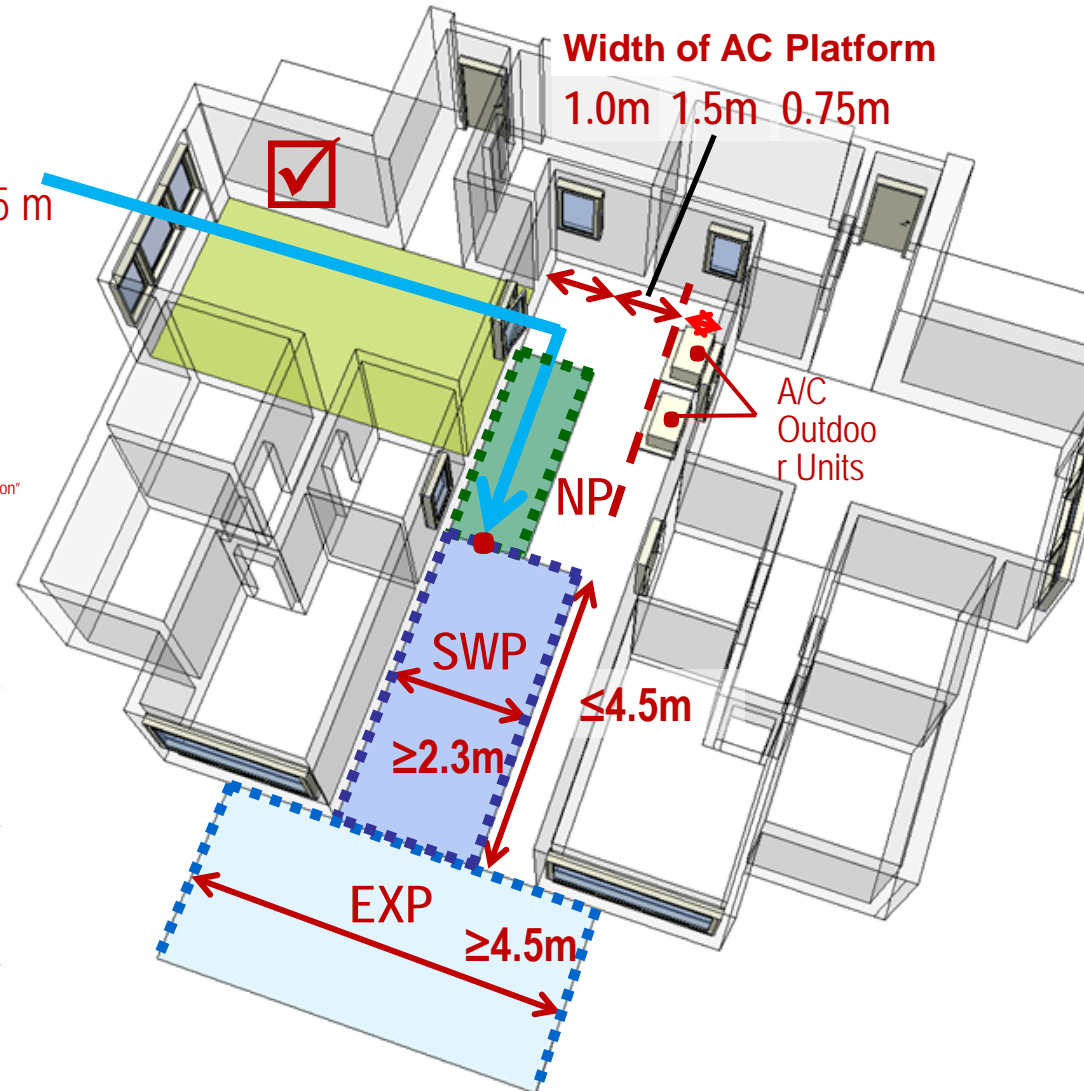

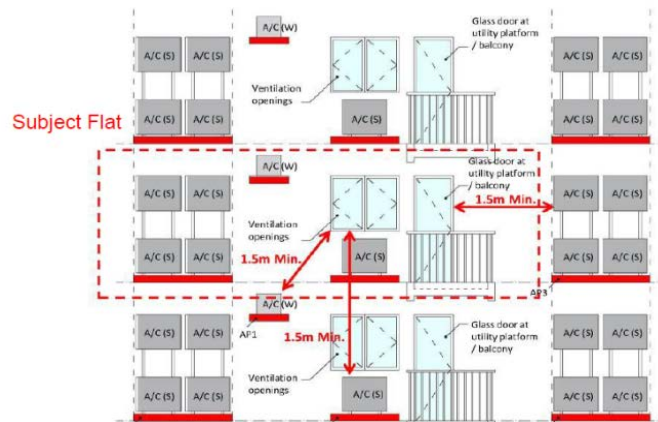

Note: Current min. prescribed openable window area  $\geq 1/16$ th (for reference)

# Heat Emissions from Air-conditioners

Required width to dissipation heat generated by AC

Francis Yik et al (2002) "Influence of a depth of a recessed space to flow due to air-conditioner heat rejection"

# Performance-based Approach

## Alternative Approach Methodology for NV<sub>TC</sub>

	Simplified Simulation Method	Site Specific Simulation Method
Process	CFD building model to assess internal conditions with standard wind conditions	CFD building & neighbourhood model to assess external & internal conditions with realistic local wind profiling
Features capture	Building layout, building features that affect NV potential	Building layout, building features, neighbourhood massing / topography, local wind conditions that affect NV potential

# Sensitivity Tests

## $NV_{TC}$ Compliance Check

$NV_c$	11%
$NV_{c \text{ (at re-entrant)}}$	37%
$NV_{ss}$	34%
Overall $NV_{TC}$	82%

### LEGEND :

- EXP : External Plane
- SWP : Secondary Window Plane
- NP : Notional Plane
- Cross Ventilation Path
- Area of habitable spaces with Cross Ventilation outside re-entrant ( $NV_c$ )
- Area of habitable spaces with Cross Ventilation at re-entrant ( $NV_{c \text{ (at re-entrant)}}$ )
- Area of habitable spaces with single-sided ventilation ( $NV_{ss}$ )
- Area of habitable spaces that do not satisfy any requirements of the above
- Area of cross ventilation path across a corridor and/or area of other room(s) (e.g. bathroom / toilet, store) with secondary ventilation opening(s)

# Potential Energy Saving

## RTTV

# Life Cycle Costing

## Change of Shading Coefficient (SC)

Case 1:

[WWR=0.5-0.6] & [Curtain Wall Construction]

RTTV<sub>(wall)</sub>

**+\$**  
+0.2~0.3%

## Change of Overhanging Projection Factor (OPF)

Case 2: [WWR=0.3-0.4] & [Window Wall Construction]

RTTV<sub>(wall)</sub>

**+\$**  
+0.2~0.3%  
+0.7~1.1%

## Change of Overhanging Projection Factor (OPF)

Case 1: [WWR=0.5-0.6] & [Curtain Wall Construction]

RTTV<sub>(wall)</sub>

**+\$**  
+0.4~0.6%  
+0.8~1.1%

## Change of Operable Window Area

**+\$**  
+0.1~0.2%  
Of total construction cost

0% → 70%

Ventilated Layout %  
0% → 60%

0% → 46%
